

ASSET MANAGEMENT

Some of our largest customers use us to manage their calibration systems for the test and measuring equipment used in their plant and field operations. By using Pulse Engineering LTD in this role, they know their test and measuring equipment is calibrated on time, with the right documentation.

Our calibration due reminders (with follow-up) work for you, and we provide summary status reports such as % on time, % passing at recall so you can monitor our performance against your quality objectives. Our data base has several available fields so you can track equipment by location, identification #'s, department, or division. We also manage preventative maintenance, obsolescence programs, and safety inspections for these same customers.

We particularly outshine the competition when we manage the assets for companies that have field service technicians spread across the country. Each technician has a set of tools that must be calibrated on a scheduled basis. We work directly with the individual technicians, providing calibrated loaners, packing materials, waybills, forwarding instructions etc. We look after the calibration details - our customers look after **their** customers!

When you use Pulse Engineering LTD for your asset management needs, you get much more than a piece of paper - you get ever increasing value from our constantly improving equipment, training, sophisticated systems, and motivated employees.

When you use Pulse Engineering LTD to manage your test and measuring assets - you will comply with the calibration requirements of your quality system with minimal (no?) personal time commitment!
